

Tran Ky Nhat

Backend Developer

District 2, Ho Chi Minh City · 0399 873 069 · tknhat.contact@gmail.com github.com/trankynhat · linkedin.com/in/tknhat

SUMMARY

Backend Developer with nearly one year of professional experience developing and maintaining backend services using Java, Spring Boot, and PostgreSQL. Experienced in REST API design, message and event processing, cross-service debugging, and client integration. Seeking to grow into a strong backend engineer by building scalable, reliable systems and taking greater ownership of production services, with a long-term focus on microservices and distributed systems.

SKILLS

- **Programming Languages:** Java, TypeScript, JavaScript, SQL
- **Backend:** Spring Boot, Spring Security, Spring Data JPA, REST APIs, WebSocket
- **Databases & Messaging:** PostgreSQL (SQL), Redis (NoSQL/Streams), RabbitMQ
- **Game & Frontend:** Cocos Creator, React, Vite
- **Development Tools:** Git, branching workflows, Docker Compose, Maven, Gradle
- **Engineering:** Event-driven systems, real-time processing, API integration, debugging, E2E testing
- **AI Integration:** Gemini API, prompt integration, fallback handling

EXPERIENCE

Fullstack Game Developer — ACE Galaxy

Oct 2025 – Present · Full-time

Online gaming platform serving the Indonesian market, with Spring Boot backend services and an Android/Cocos client.

- Developed and maintained backend features using Java, Spring Boot, PostgreSQL, Redis, and RabbitMQ.
- Improved an event-processing pipeline by migrating legacy queue processing to Redis Streams and Consumer Groups, increasing processing efficiency and reliability.
- Designed REST APIs and wrote technical documentation for client integration.
- Investigated and resolved cross-service issues by tracing event flows and collaborating with backend and client teams.

Tech: Java 17, Spring Boot, PostgreSQL, Redis Streams, RabbitMQ

PROJECTS

AgriSense — Real-time Smart Farm Monitoring

Personal project · Spring Boot · React/TypeScript · Redis Streams · WebSocket · Gemini AI github.com/trankynhat/agrisense-smart-farm

End-to-end platform for farm sensor ingestion, real-time monitoring, threshold alerts, and AI-assisted crop-health analysis. Built to demonstrate production-oriented streaming patterns. **Sole developer** — owned the full development lifecycle: database design, backend, frontend, testing, and documentation.

- Built a Redis Streams ingestion pipeline with consumer groups, at-least-once processing, manual acknowledgement, and pending-entry recovery after consumer failure.
- Delivered live sensor readings and threshold alerts through authenticated WebSocket/STOMP channels to a React dashboard.
- Secured APIs with stateless JWT authentication, BCrypt, and resource ownership checks.
- Integrated Google Gemini with fallback handling and created E2E smoke tests covering ingestion, alerts, real-time delivery, and AI fallback behavior.

EDUCATION

University of Science, VNU-HCM — B.Sc. Information Systems · 2020 – 2024
